FAQ

Q: Where can I have my soil tested?

A: University of Florida Soil Lab

Q: What is the seed rate for a yard?

A: Bahia ~ 5-10 pounds per 1000 sq. ft.

A: Bermuda ~ 3-5 pounds per 1000 sq. ft.

A: Cenitpede ~ 2-3 pounds per 1000 sq. ft.

A: Zoysia ~ 2-3 pounds per 1000 sq. ft.

A: Seapray ~ 2-3 pounds per 1000 sq. ft.

Q: When is it safe to mow after seeding?

A: Mow when the grass has reached a least 4" in height, Mowing earlier can damage the young seedlings.

Q: What is the seed rate for a pasture?

A: 20-100 pounds per acre, depending on what type seed you want to plant and how fast you want it to establish a turf.

Q: What is the better Bahiagrass seed for my yard?

A: Argentine Bahiagrass...it is not as tough on your mower as Pensacola Bahiagrass.

Q: What herbicide should I use to kill weeds?

A: Contact your local fertilizer company for recomendations pertaining to your specific grass variety.

Q: How often should I water my yard?

A: Fresh planted seeds should be watered on a daily basis. Watering in the late afternoon or evening will maximise your watering and increase the germination time.

Q: When should I fertilize my yard?

A: The best results would be to spread your fertilize out when you seed your yard.

A: Established yard: Fertilize in the Spring generally after the last frost. DO NOT fertilize when your grass is young and tender.

Q: What type fertilizer should I use on my yard?

A: 16-4-8 is a good one to use...however if not available, the higher the first number the better the fertilizer will be.

Q: How do I cover the seed once planted?

A: Use a light drag or rake. Drags are usually homemade with chain link fence and 4x4 posts.
